

Amendments to the Claims:

1. (Currently Amended) ~~An apparatus~~ A mobile station comprising:
a context engine configured to store context-related information, the context-related information having been created based upon at least a portion of at least one condition measured by at least one sensor, wherein the context engine is also configured to manage an exchange of the context-related information with at least one context consumer;
a communication manager configured to communicate with at least one context consumer to receive at least one context rule and exchange context-related information, the at least one context consumer located external to the mobile station ~~apparatus~~, wherein at least one context rule includes at least one condition value relating to at least a portion of context-related information, and at least one action to be performed; and
a script engine configured to execute at least a portion of at least one context rule, including being configured to perform at least a portion of a respective at least one action, based on a comparison of the respective at least one condition value and the at least one condition measured by the at least one sensor.
2. (Currently Amended) A mobile station ~~An apparatus~~ according to Claim 1, wherein the context engine comprises:
a blackboard configured to store the context-related information; and
a subscription manager configured to provide at least one subscription to at least a portion of the context-related information to at least one context consumer.
3. (Currently Amended) A mobile station ~~An apparatus~~ according to Claim 2, wherein the context-related information is retrievable from or stored by the blackboard.
4. (Currently Amended) A mobile station ~~An apparatus~~ according to Claim 1, wherein the context-related information is stored as at least one context atom that comprises at least a name and an associated value.

5. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 4, wherein the at least one context atom further comprises at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

6. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 5, wherein at least a portion of the context-related information is based upon at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

7. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1 further comprising:

a subscription manager configured to permit at least one context consumer to subscribe to at least one event regarding at least a portion of the context-related information.

8. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1, wherein the context engine is configured to store context-related information from at least one context producer, and wherein the at least one context producer comprises at least one of an application internal to the ~~apparatus~~ mobile station, an application external to the ~~apparatus~~ mobile station or a user of the ~~apparatus~~ mobile station.

9. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1 further comprising:

at least one sensor configured to measure at least a portion of at least one condition of at least one of the ~~apparatus~~ mobile station or a user of the mobile station~~apparatus~~.

10. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 9, wherein the at least one sensor is further configured to process the portion of the at least one condition into context-related information.

11. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1 further comprising:

a privacy engine configured to provide at least a portion of at least one of security or privacy to the exchange of the context-related information.

12. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 11, wherein the privacy engine is configured to operate in accordance with the at least one received rule to one of grant or deny permission to exchange context-related information with at least one context consumer.

13. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1, wherein the communication manager is configured to manage connectivity with at least one context producer for the exchange of context-related information, and wherein the communication manager is further configured to abstract at least one communication technology such that the context engine is configured to operate independent of the at least one communication technology.

14. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1, wherein the context engine is configured to transmit at least a portion of the context-related information to at least one context consumer external to the ~~apparatus~~ mobile stations such that the at least one context consumer is configured to determine a context of the ~~apparatus~~ mobile station based upon the transmitted portion of the context-related information.

15. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1, wherein the context engine is configured to communicate with at least one external device according to a context exchange protocol that defines a format in which the context-related information is at least one of transmitted or received.

16. (Cancelled)

17. (Cancelled)

18. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1, wherein a context consumer comprises an application ~~for configured to monitoring~~ a health of a user of the ~~apparatus~~ mobile station, wherein at least one context rule relates to the health of the user, and wherein the respective at least one context rule comprises at least a portion of at least one condition relating to the health of the user, and an alert to be issued when the respective portion of the at least one condition is satisfied.

19. (Currently Amended) A mobile station~~An apparatus~~ according to Claim 1 further comprising:

at least one application program interface configured to facilitate at least one of the transmission or reception of context-related information.

20. (Previously Presented) A system comprising:

at least one context producer configured to create context-related information based upon at least a portion of at least one condition measured by at least one sensor;

at least one context consumer configured to determine a context based upon the context-related information; and

a mobile station configured to store context-related information created by the at least one context producer, wherein the mobile station is also configured to receive at least one context rule from at least one context consumer located external to the mobile station, and manage an exchange of the context-related information between the at least one context producer and the at least one context consumer, and wherein at least one context rule includes at least one condition value relating to at least a portion of context-related information, and at least one action to be performed,

wherein the mobile station comprises a script engine configured to execute at least a portion of at least one context rule, including being configured to perform at least a portion of a respective at least one action, based on a comparison of the respective at least one condition value and the at least one condition measured by the at least one sensor.

21. (Previously Presented) A system according to Claim 20, wherein the mobile station comprises a context engine configured to store the context-related information, and provide at least one subscription to at least a portion of the context-related information to the at least one context consumer.

22. (Previously Presented) A system according to Claim 21, wherein the context-related information is retrievable from or stored by the context engine.

23. (Previously Presented) A system according to Claim 20, wherein the mobile station is configured to store context-related information as at least one context atom that comprises at least a name and an associated value.

24. (Previously Presented) A system according to Claim 23, wherein the mobile station is configured to store context-related information as at least one context atom that further comprises at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

25. (Previously Presented) A system according to Claim 24, wherein at least a portion of the context-related information is based upon at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

26. (Previously Presented) A system according to Claim 20, wherein the mobile station comprises a subscription manager configured to permit at least one context consumer to subscribe to at least one event regarding at least a portion of the context-related information.

27. (Previously Presented) A system according to Claim 20, wherein the at least one context producer comprises at least one of an application internal to the mobile station, an application external to the mobile station or a user of the mobile station.

28. (Previously Presented) A system according to Claim 20, wherein the at least one context producer comprises at least one sensor configured to measure at least a portion of at least one condition of at least one of the mobile station or a user of the mobile station.

29. (Previously Presented) A system according to Claim 28, wherein the at least one sensor is further configured to process the portion of the at least one condition into context-related information.

30. (Previously Presented) A system according to Claim 20, wherein the mobile station comprises a privacy engine configured to provide at least a portion of at least one of security or privacy to the exchange of the context-related information.

31. (Previously Presented) A system according to Claim 30, wherein the privacy engine is configured to operate in accordance with at least one rule to one of grant or deny permission to exchange context-related information with the at least one context consumer.

32. (Previously Presented) A system according to Claim 20, wherein the mobile station comprises a communication manager configured to manage connectivity with the at least one context producer for the exchange of context-related information, and wherein the communication manager is further configured to abstract at least one communication technology such that the mobile station is configured to operate independent of the at least one communication technology.

33. (Previously Presented) A system according to Claim 20, wherein the mobile station is configured to transmit at least a portion of the context-related information to the at least one context consumer external to the mobile station such that the at least one context consumer is configured to determine a context of the mobile station based upon the transmitted portion of the context-related information.

34. (Previously Presented) A system according to Claim 20, wherein the mobile station is configured to communicate with at least one external device according to a context exchange protocol that defines a format in which the context-related information is at least one of transmitted or received.

35. (Cancelled)

36. (Cancelled)

37. (Previously Presented) A system according to Claim 20, wherein a context consumer comprises an application for monitoring a health of a user of the mobile station, wherein at least one context rule relates to the health of the user, and wherein the respective at least one context rule comprises at least a portion of at least one condition relating to the health of the user, and an alert to be issued when the respective portion of the at least one condition is satisfied.

38. (Previously Presented) A system according to Claim 20, wherein the mobile station comprises at least one application program interface configured to facilitate at least one of the transmission or reception of context-related information.

39. (Previously Presented) A system according to Claim 20 further comprising:

at least one electronic device configured to communicate with the mobile station, wherein the at least one electronic device comprises a context engine configured to store at least a portion of the context-related information stored by the mobile station.

40. (Currently Amended) A method for operating a mobile station, comprising:
storing context-related information, the context-related information having been created based upon the portion of the at least one condition measured by at least one sensor;
receiving at an ~~apparatus~~ the mobile station at least one context rule from at least one context consumer located external to the ~~apparatus~~ mobile station, the at least one context rule including at least one condition value relating to at least a portion of context-related information, and at least one action to be performed; and
managing at the ~~apparatus~~ mobile station an exchange of the context-related information with at least one context consumer, wherein managing the exchange comprises:
receiving a request for at least a portion of the context-related information from a context consumer;
transmitting the requested portion of the context-related information to the respective context consumer in response to the request; and
executing at least one context rule, including performing at least a portion of a respective at least one action, based on a comparison of the respective at least one condition value and the at least one condition measured by the at least one sensor.

41. (Original) A method according to Claim 40, wherein managing an exchange of the context-related information further comprises:
providing at least one subscription to at least a portion of the context-related information to the at least one context consumer.

42. (Original) A method according to Claim 40, wherein storing context-related information comprises storing context-related information as at least one context atom that comprises at least a name and an associated value.

43. (Previously Presented) A method according to Claim 42, wherein storing context-related information comprises storing context-related information as at least one context atom that further comprises at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

44. (Previously Presented) A method according to Claim 43, wherein at least a portion of the context-related information is based upon at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

45. (Previously Presented) A method according to Claim 40 further comprising measuring at least a portion of at least one condition, wherein measuring at least a portion of at least one condition comprises measuring at least a portion of at least one condition by at least one context producer comprising at least one of an application internal to the mobile station, an application external to the mobile station or a user of the mobile station.

46. (Previously Presented) A method according to Claim 40 further comprising measuring at least a portion of at least one condition, wherein measuring at least a portion of at least one condition further comprises processing the portion of the at least one condition into context-related information.

47. (Currently Amended) A method according to Claim ~~65~~ 40, wherein ~~determining whether to grant permission comprises managing an exchange of the context-related includes~~ determining whether to grant permission to exchange context-related information in accordance with at least one rule.

48. (Previously Presented) A method according to Claim 40, wherein transmitting the requested portion of the context-related information comprises transmitting the requested portion of the context-related information to at least one context consumer external to the mobile station

such that the at least one context consumer is configured to determine a context of the mobile station based upon the transmitted portion of the context-related information.

49. (Cancelled)

50. (Cancelled)

51. (Previously Presented) A method according to Claim 40, wherein a context consumer comprises an application for monitoring a health of a user of the mobile station, wherein at least one context rule relates to the health of the user, and wherein the respective at least one context rule comprises at least a portion of at least one condition relating to the health of the user, and an alert to be issued when the respective portion of the at least one condition is satisfied.

52. (Currently Amended) ~~A computer program product comprising at least one computer-readable storage medium having computer-readable program code portions stored therein, the computer-readable program code portions comprising:~~

~~a first executable portion configured to store context-related information~~ a mobile station, the context-related information having been created based upon the portion of the at least one condition measured by at least one sensor;

~~a second executable portion configured to receive at an apparatus~~ the mobile station at least one context rule from at least one context consumer located external to the ~~apparatus~~ mobile station, the at least one context rule including at least one condition value relating to at least a portion of context-related information, and at least one action to be performed; and

~~a third executable portion configured to manage at the apparatus~~ mobile station an exchange of the context-related information with at least one context consumer, wherein the third executable portion is configured to receive a request for at least a portion of the context-related information from a context consumer, and ~~transmit~~ provide for transmission of the requested

portion of the context-related information to the respective context consumer in response to the request,

wherein the third executable portion is further configured to execute at least one context rule, including performing at least a portion of a respective at least one action, based on a comparison of the respective at least one condition value and the at least one condition measured by the at least one sensor.

53. (Currently Amended) A ~~computer program product~~computer-readable storage medium according to Claim 52, wherein the third executable portion is further configured to provide at least one subscription to at least a portion of the context-related information to the at least one context consumer.

54. (Currently Amended) A ~~computer program product~~computer-readable storage medium according to Claim 52, wherein the first executable portion is configured to store context-related information as at least one context atom that comprises at least a name and an associated value.

55. (Currently Amended) A ~~computer program product~~computer-readable storage medium according to Claim 54, wherein the first executable portion is configured to store context-related information as at least one context atom that further comprises at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

56. (Currently Amended) A ~~computer program product~~computer-readable storage medium according to Claim 55, wherein at least a portion of the context-related information is based upon at least one of a timestamp, a source identifier, a reliability of the respective value, or an accuracy of the respective value.

57. (Currently Amended) A ~~computer program product~~ computer-readable storage medium according to Claim 52, wherein the computer-readable program code portions further comprise a third executable portion configured to measure at least a portion of at least one condition, wherein the third executable portion is further configured to process the portion of the at least one condition into context-related information.

58. (Currently Amended) A ~~computer program product~~ computer-readable storage medium according to Claim 67, wherein the third executable portion is configured to determine whether to grant permission in accordance with at least one rule.

59. (Currently Amended) A ~~computer program product~~ computer-readable storage medium according to Claim 52, wherein the third executable portion is configured to ~~transmit~~ provide for transmission of the requested portion of the context-related information to at least one context consumer external to the mobile station such that the at least one context consumer is configured to determine a context of the mobile station based upon the transmitted portion of the context-related information.

60. (Cancelled)

61. (Cancelled)

62. (Currently Amended) A ~~computer program product~~ computer-readable storage medium according to Claim 52, wherein a context consumer comprises an application for monitoring a health of a user of the mobile station, wherein at least one context rule relates to the health of the user, and wherein the respective at least one context rule comprises at least a portion of at least one condition relating to the health of the user, and an alert to be issued when the respective portion of the at least one condition is satisfied.

63. (Currently Amended) ~~An apparatus~~A mobile station according to Claim 1, wherein the context-related information is stored as at least one context atom that comprises at least a name and an associated value, the ~~apparatus~~mobile station further comprising:

a subscription manager configured to provide a context consumer with a subscription to a context atom to thereby permit the respective context consumer to receive a notification when the respective context atom changes.

64. (Previously Presented) A method according to Claim 40, wherein storing context-related information comprises storing context-related information as at least one context atom that comprises at least a name and an associated value, and wherein managing an exchange of the context-related information further comprises:

providing a context consumer with a subscription to a context atom to thereby permit the respective context consumer to receive a notification when the respective context atom changes.

65. (Previously Presented) A method according to Claim 40, wherein managing an exchange further comprises:

determining whether to grant permission for the context consumer to receive the requested portion of the context-related information, and

wherein transmitting the requested portion comprises transmitting the requested portion of the context-related information when permission is granted.

66. (Currently Amended) ~~A computer program product~~computer-readable storage medium according to Claim 52, wherein the first executable portion is configured to store context-related information as at least one context atom that comprises at least a name and an associated value, and

wherein the third executable portion is further configured to provide a context consumer with a subscription to a context atom to thereby permit the respective context consumer to receive a notification when the respective context atom changes.

67. (Currently Amended) A ~~computer program product~~ computer-readable storage medium according to Claim 52, wherein the third executable portion being configured to manage an exchange further comprises being configured to determine whether to grant permission for the context consumer to receive the requested portion of the context-related information, and

wherein the third executable portion being configured to transmit the requested portion includes being configured to transmit the requested portion of the context-related information when permission is granted.

68. (New) A mobile station comprising a processor and a memory storing executable instructions that in response to execution by the processor cause the apparatus to at least perform the following:

storing context-related information, the context-related information having been created based upon the portion of the at least one condition measured by at least one sensor;

receiving at the mobile station at least one context rule from at least one context consumer located external to the mobile station, the at least one context rule including at least one condition value relating to at least a portion of context-related information, and at least one action to be performed; and

managing at the mobile station an exchange of the context-related information with at least one context consumer, wherein managing the exchange comprises:

receiving a request for at least a portion of the context-related information from a context consumer;

transmitting the requested portion of the context-related information to the respective context consumer in response to the request; and

executing at least one context rule, including performing at least a portion of a respective at least one action, based on a comparison of the respective at least one condition value and the at least one condition measured by the at least one sensor.

69. (New) A mobile station according to Claim 68, wherein managing an exchange of the context-related information further comprises:

providing at least one subscription to at least a portion of the context-related information to the at least one context consumer.

70. (New) A mobile station according to Claim 68, wherein the memory stores executable instructions that in response to execution by the processor cause the apparatus to further perform the following:

measuring at least a portion of at least one condition, wherein measuring at least a portion of at least one condition comprises measuring at least a portion of at least one condition by at least one context producer comprising at least one of an application internal to the mobile station, an application external to the mobile station or a user of the mobile station.
